

Dr Sherry Nakhaeizadeh's principle research interests include the effect of cognitive bias in forensic science and criminal investigations. She is particularly interested in judgment and decision-making in forensic anthropology and the approaches of evidence analysis in forensic science. Sherry's current research looks into the use of eye-tracking technology in forensic decision-making, and how such technology could aid in an empirical approach to advancing the understanding of complex visual tasks in forensic anthropology specifically, and forensic science broadly. This project is in collaboration with Teesside University and Portsmouth University.

Sherry has presented at a number of international conferences, including the International Symposium held by the Australian and New Zealand Forensic Science Society (ANZFSS) where she was a keynote presenter in the Anthropology and Archeology session in both 2014 and 2016.
