

Participants Wanted for Study

Neurofeedback to improve motor control after spinal cord injury

We are looking for people who had an incomplete spinal cord injury more than one year ago and, at the present time, are showing spasticity in the arms and/or legs.

You are invited to take part in a research study to test a rehabilitation therapy to reduce spasticity in people who have suffered an incomplete spinal cord injury. In this study, we will record your brain activity using electroencephalography (EEG), which is a safe and widely used recording technique.

Your participation would require attending five therapy sessions over 2 weeks, each lasting up to two hours.

If you are between 18 and 80 years of age, have a chronic incomplete spinal cord injury and would like more information about the project, please contact your clinical consultant or Dr Vuckovic directly by telephone **0790 644 1955** or **0141 232 7884** or by email at aleksandra.vuckovic@glasgow.ac.uk. Our research facilities are located upstairs above the gym at the Spinal Unit, please feel free to arrange a visit.
